BATCH: S23

UNIX LAB ASSIGNMENT NO.6 AWK, SED, GREP Commands

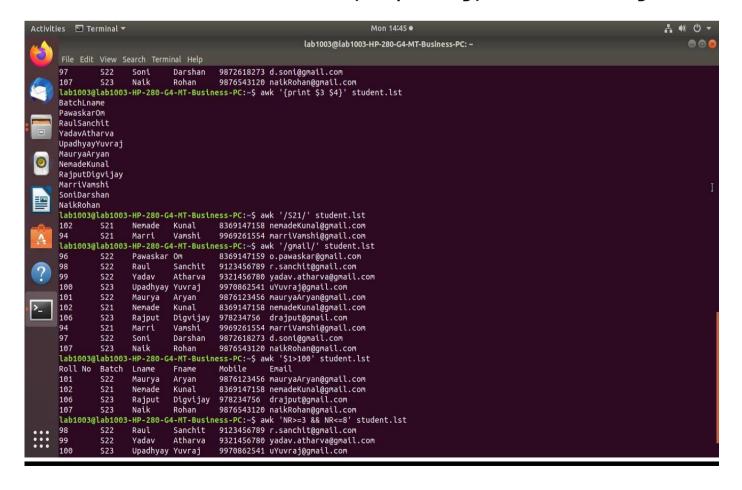

AWK COMMANDS:

AWK is a powerful programming language and command-line utility for pattern scanning and text processing.

Used for processing and analyzing text data, particularly when data is organized in columns.

It operates on a line-by-line basis, applying actions to lines that match specified patterns.

Often used for data extraction, reporting, and formatting.

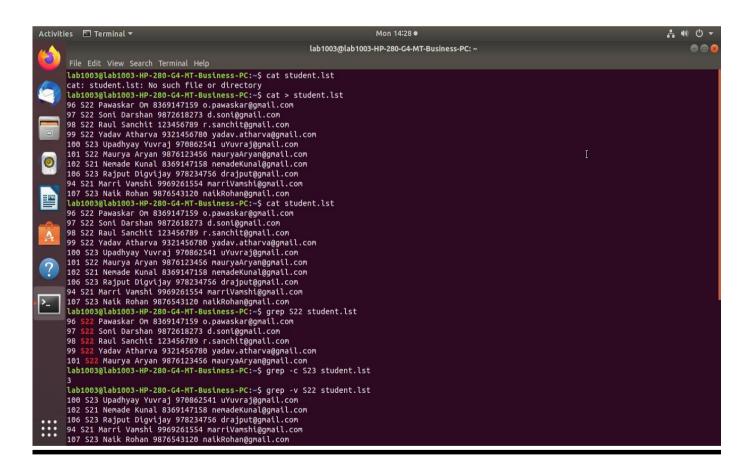

GREP COMMANDS:

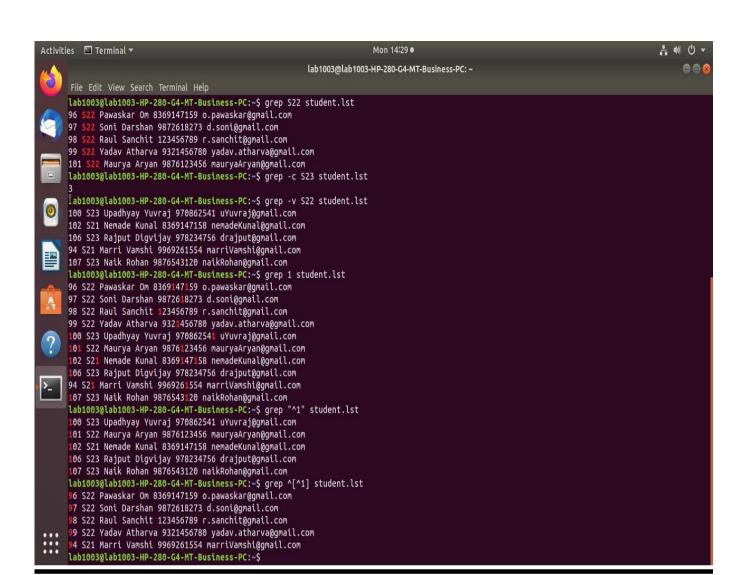

Purpose: grep is a command-line utility for searching plain-text data sets for lines that match a regular expression.

Used for searching and filtering text based on patterns.

Displays lines from a file or output that match the specified pattern.

It can be combined with other commands using pipes (|) to perform more complex text processing.

SED COMMANDS:

Purpose: sed (stream editor) is a text stream processing command that performs basic text transformations on an input stream.

Primarily used for search and replace operations in a text file or stream.

Can be used for more complex text manipulations, such as inserting or deleting lines, based on specified patterns.

Works well in pipelines with other commands.
